
PROFILE SUMMARY

- Cloud Engineer with 6 years of experience designing and operating cloud platforms across financial services, ride-sharing, and SaaS workloads, specializing in cloud architecture, infrastructure as code, and cost optimization.
- Solid technical background across clouds (AWS, Azure, GCP), IaC tools (Terraform, CloudFormation), and compute (EKS, Lambda, ECS Fargate) with strong fundamentals in Python and Bash automation.
- Deep expertise in Well-Architected Framework, multi-account organizations, defense-in-depth security, and zero-downtime migrations, leveraging methodologies such as landing zones and GitOps to drive scalable, resilient, and cost-aware cloud platforms.
- Engaged collaborator working cross-functionally with Application, Security, and Finance teams in Agile environments, contributing to architecture reviews, RFC discussions, and incident retrospectives with a pragmatic, ownership-first mindset.
- Emerging leader who shares technical excellence and fosters a culture of operational excellence and cost discipline through PR reviews and runbooks, while leading cloud guild sessions and authoring widely adopted Terraform module templates.

TECHNICAL SKILLS

Cloud Platforms:	AWS (EC2, EKS, Lambda, RDS, S3, IAM), Azure (AKS, Functions), GCP (GKE)
Infrastructure as Code:	Terraform, CloudFormation, Pulumi, Bicep, Ansible
Compute & Containers:	EKS, Lambda, ECS Fargate, Docker, Kubernetes
Networking & CDN:	VPC, Transit Gateway, Direct Connect, Route 53, CloudFront, VPN
Security & Identity:	IAM, KMS, Secrets Manager, GuardDuty, SOC 2, PCI DSS
Storage & Databases:	S3, EFS, RDS Aurora, DynamoDB, ElastiCache, Backup & DR
Observability & FinOps:	CloudWatch, Datadog, Cost Explorer, Savings Plans, tagging policies
Automation & CI/CD:	GitHub Actions, Jenkins, Spinnaker, Python, Bash

EDUCATION

Carnegie Mellon University B.S. in Information Systems

Pittsburgh, PA • Sep 2015 - May 2019

WORK EXPERIENCE

Capital One Senior Cloud Engineer

Charlotte, NC • Aug 2022 - Present

- Own the cloud platform for a multi-account AWS Organization spanning 180+ accounts, coordinating architecture reviews, infrastructure as code, and cost and reliability across 220 engineers under the Well-Architected Framework.
- Authored the Terraform module library for account scaffolding and shared services, shipping reusable bootstrap modules, policy-as-code guardrails, and GitOps pipelines via Atlantis across 180+ AWS accounts, cutting per-team provisioning lead time from 3 weeks to 2 days.
- Standardized workload-aware placement across EKS (stateful services), Lambda (event-driven workloads), and ECS Fargate (batch jobs), onboarding 220+ services and cutting compute spend by 34%.
- Designed the multi-region VPC architecture on Transit Gateway hub-and-spoke with Direct Connect circuits and centralized egress through inspection VPCs, connecting 180+ accounts at 62ms p95 cross-region latency with zero unplanned outages over 18 months.
- Drove the FinOps program around a Savings Plan portfolio, org-wide tagging policy enforcement, and rightsizing

automation via **Compute Optimizer**, cutting annual cloud spend by **22%** (~\$8.4M) while holding all production SLOs.

- Built the unified observability stack on **CloudWatch** and **Datadog**, defining SLO dashboards, alert routing, and on-call runbooks for **60+** critical services and reducing mean time to detect from **14 minutes** to **90 seconds**.
- Led the migration of **40+** legacy applications from on-prem to AWS, defaulting to **replatform to ECS Fargate** with lift-and-shift or event-driven refactor where the workload demanded, including a rebuild of the **card-issuance platform** that cut infrastructure cost by **46%** and lifted deployment frequency by **6x**.

Lyft **Cloud Engineer**

San Francisco, CA • Jul 2019 - Jul 2022

- Designed AWS IAM and KMS strategy across **60+** accounts on **least-privilege IAM**, **customer-managed KMS**, and centralized secrets rotation, hardening the platform against **SOC 2 Type II** and **PCI DSS** controls and cutting audit findings from **34** to **0** across two consecutive audits.
- Owned the managed-database fleet across **RDS Aurora**, **DynamoDB**, and **ElastiCache** with **80+** clusters, running **cross-region replication**, point-in-time recovery, and **quarterly** failover drills, cutting database-related production incidents by **58%** year over year.
- Built the team's cloud deployment platform on **Spinnaker** with canary analysis via **Kayenta** and auto-rollback on SLO breach, operating **180+** pipelines and cutting commit-to-prod lead time from **3 hours** to **14 minutes**.
- Partnered with **Application**, **Security**, and **SRE** teams across **9** product domains on cloud-account topology, shared-service ownership, and incident response runbooks, authoring **11** cloud-architecture RFCs that shaped the org's landing-zone standard and onboarding **14** cloud engineers.
