

PROFILE SUMMARY

- Back-End Engineer with 7 years of experience designing and operating large-scale services across e-commerce platforms, developer tools, and B2B SaaS, specializing in distributed systems, API contract design, and high-throughput data persistence.
- Solid technical background across languages (Go, Python, Java), frameworks (gRPC, FastAPI, Spring Boot), data stores (Postgres, DynamoDB, Redis), messaging (Kafka, RabbitMQ), and cloud (AWS, GCP) with strong fundamentals in SQL and Linux internals.
- Deep expertise in domain-driven design, event-sourced architectures, idempotent processing, and zero-downtime migrations, leveraging methodologies such as hexagonal architecture and CQRS to drive maintainable, scalable, and observable services.
- Engaged collaborator working cross-functionally with Product, Mobile, and Platform teams in Agile environments, contributing to API contract reviews, RFC discussions, and on-call retrospectives with a pragmatic, ownership-first mindset.
- Emerging leader who shares technical excellence and fosters a culture of operational rigor and code quality through PR reviews and runbooks, while leading backend guild sessions and authoring widely adopted service templates.

TECHNICAL SKILLS

Languages & Scripting:	Go, Python, Java, SQL, Bash
Frameworks & APIs:	gRPC, FastAPI, Spring Boot, GraphQL, REST
Databases:	PostgreSQL, MySQL, DynamoDB, Redis, MongoDB
Messaging & Async:	Kafka, RabbitMQ, SQS, Pub/Sub, Celery
Performance & Caching:	Redis, Memcached, CDN, connection pooling
Cloud Platforms:	AWS (ECS, Lambda, RDS, S3, IAM), GCP (GKE, Cloud SQL)
Testing & Quality:	PyTest, JUnit, Postman, Pact, k6
DevOps & CI/CD:	Docker, Kubernetes, Terraform, GitHub Actions, Datadog

EDUCATION

Georgia Institute of Technology B.S. in Computer Science Atlanta, GA • Sep 2014 - May 2018

WORK EXPERIENCE

GitHub Back-End Engineer Seattle, WA • Sep 2021 - Present

- Own service architecture for the GitHub Issues platform supporting 120M+ MAU, leading end-to-end design and operation across API contracts, read/write throughput, and on-call reliability within a polyglot service mesh.
- Designed and shipped a GraphQL API for issue search and triage, defining schema versioning, deprecation conventions, and persisted-query support, reducing client payload size by 42% and cutting average query latency from 380ms to 120ms across 8 internal consumers.
- Architected a partitioned PostgreSQL schema for issue activity history, using range partitioning by month, covering indexes, and a logical-replication-based zero-downtime migration, reducing p99 query time on 2B+ rows from 2.4s to 180ms.
- Built an event-driven notification pipeline in Go on Kafka with at-least-once delivery, idempotent consumers, and consumer-side dedup, processing 400M+ events/day at 99.99% delivery success and sub-second end-to-end fan-out.
- Optimized hot-path API endpoints through Redis read-through caching, connection-pool tuning, and EXPLAIN ANALYZE

query plans, lifting throughput by 3.5x (from 2k to 7k RPS) and cutting p95 latency by 58% during peak load.

- Instrumented services with **OpenTelemetry traces**, structured JSON logs, RED dashboards in Grafana, and SLO-based alerting via Prometheus, reducing mean time to detect from **18 minutes** to **90 seconds** and time to resolution by **62%** across **6** incident drills.
- Refactored the **billing-events** domain using **hexagonal architecture** with **adapter-port boundaries**, command handlers, and aggregate-root invariants, eliminating **15** long-standing race conditions and shipping the largest domain rewrite in **4** years without a customer-visible regression.

Atlassian **Back-End Engineer**

Boston, MA • Jun 2018 - Aug 2021

- Implemented **OAuth 2.1 + PKCE** authentication for the **public Jira API**, building **scoped JWT tokens** with refresh-token rotation, token introspection, and rate-limited brute-force protection, hardening the auth surface against **OWASP Top 10** risks and powering **5,000+** active integrations.
- Established the team's testing strategy with **JUnit** (unit), ephemeral Docker stacks (integration), and Pact (contract), raising overall service test coverage from **47%** to **88%** and catching **22+** regressions during pre-release cycles.
- Owned CI/CD pipelines for **8** backend services, automating **canary rollouts on Kubernetes** with schema-migration gating and post-deploy smoke checks, reducing deploy lead time from **4 hours** to **22 minutes** and rolling back **3** silent regressions within minutes.
- Worked closely with **Product, Mobile, and SRE** teams across **3** product surfaces to negotiate **API contract changes**, deprecation timelines, and migration paths, authoring **15+** technical RFCs that shaped the org's backwards-compatibility policy and onboarding **9** new engineers.
